

Sprint 2 - test Cases

Date	18 November 2022
Team ID	PNT2022TMID51524
Project Name	VirtualEye - Lifeguard for swimming pools to detect active drowning

In the second sprint we worked on the page content of the about and demo pages. These are the central pages to our project and reflect the information about the motivation, working and solution proposed by our project.

Virtual Eye - Life Guard for Swimming Pools to Detect Active Drowning

ABOUT PROJECT

Problem:

Swimming is one of the best exercises that helps people to reduce stress in this urban lifestyle. Swimming pools are found larger in number in hotels, and weekend tourist spots and barely people have them in their house backyard. Beginners, especially, often feel it difficult to breathe underwater which causes breathing trouble which in turn causes a drowning accident. Worldwide, drowning produces a higher rate of mortality without causing injury to children. Children under six of their age are found to be suffering the highest drowning mortality rates worldwide. Such kinds of deaths account for the third cause of unplanned death globally, with about 1.2 million cases yearly. To overcome this conflict, a meticulous system is to be implemented along the swimming pools to save human life

Solution:

By studying body movement patterns and connecting cameras to artificial intelligence (AI) systems we can devise an underwater pool safety system that reduces the risk of drowning. Usually, such systems can be developed by installing more than 16 cameras underwater and ceiling and analyzing the video feeds to detect any anomalies, but AS a POC we make use of one camera that streams the video underwater and analyses the position of swimmers to assess the probability of drowning, if it is higher then an alert will be generated to attract lifeguards' attention.

Virtual Eye - Life Guard for Swimming Pools to Detect Active Drowning

Swimming is one of the best exercises that helps people reduce stress in this urban lifestyle. Swimming pools are found in large numbers in hotels, weekend tourist spots and in some rare cases, people's backyards. Beginners often find it difficult to control their breath while underwater and this may cause breathing trouble which in turn may cause a drowning accident. Worldwide, drowning produces a high rate of mortality without causing injury among children. Children under the age of 6 are found to be at the greatest risk of drowning. Such kinds of deaths account for a third of accidental deaths globally, with about 1.2 million cases yearly. Thus, we need a suitable system in place to detect active drowning to prevent loss of life.
